

FAVORIT® Measuring Cylinders and Mixing Cylinders

FAVORIT® measuring cylinders are used to measure the volume of liquid while mixing cylinders are used to measure, mixing different components in different ratio and for dilutions. They are used sometimes to indirectly measure the volume of solid by measuring the displacement of liquid.

FAVORIT® measuring and mixing cylinders are available in Class A and Class B precisions. Class A cylinders are graduated with main ring point graduations and Class B with line graduations in either amber or blue.
